Q Answer the following:

Q1 Why does human body need proteins?

Ans Protein are called body-building nutrients. Our body needs protein to help us grow bigger and stronger. Protein also helps to repair the damaged and injured body parts.

2. What is a balanced diet?

Ans A diet that provides all types of nutrients in the right ^{amount} is called balanced diet.

3. What happens to the foods in the small intestine?

Ans In the small intestine, digestive juices from the liver, pancreas get mixed with the food. These digestive juices digest carbohydrates, proteins and fats present in the food. Digestion of the food is completed in the small intestine.

Q How is digestion in the mouth different from digestion in the stomach?

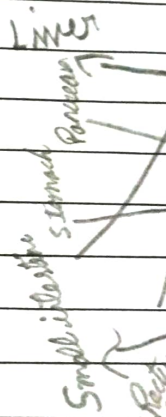

Ans The food we eat is ground into small pieces by our teeth. The food mixes with the saliva in the mouth. Saliva is a digestive juice which breaks down complex carbohydrates into sugars.

Stomach churns the food into a fine paste.

Q Why is it important for the food to travel through our digestive system slowly rather than quickly?

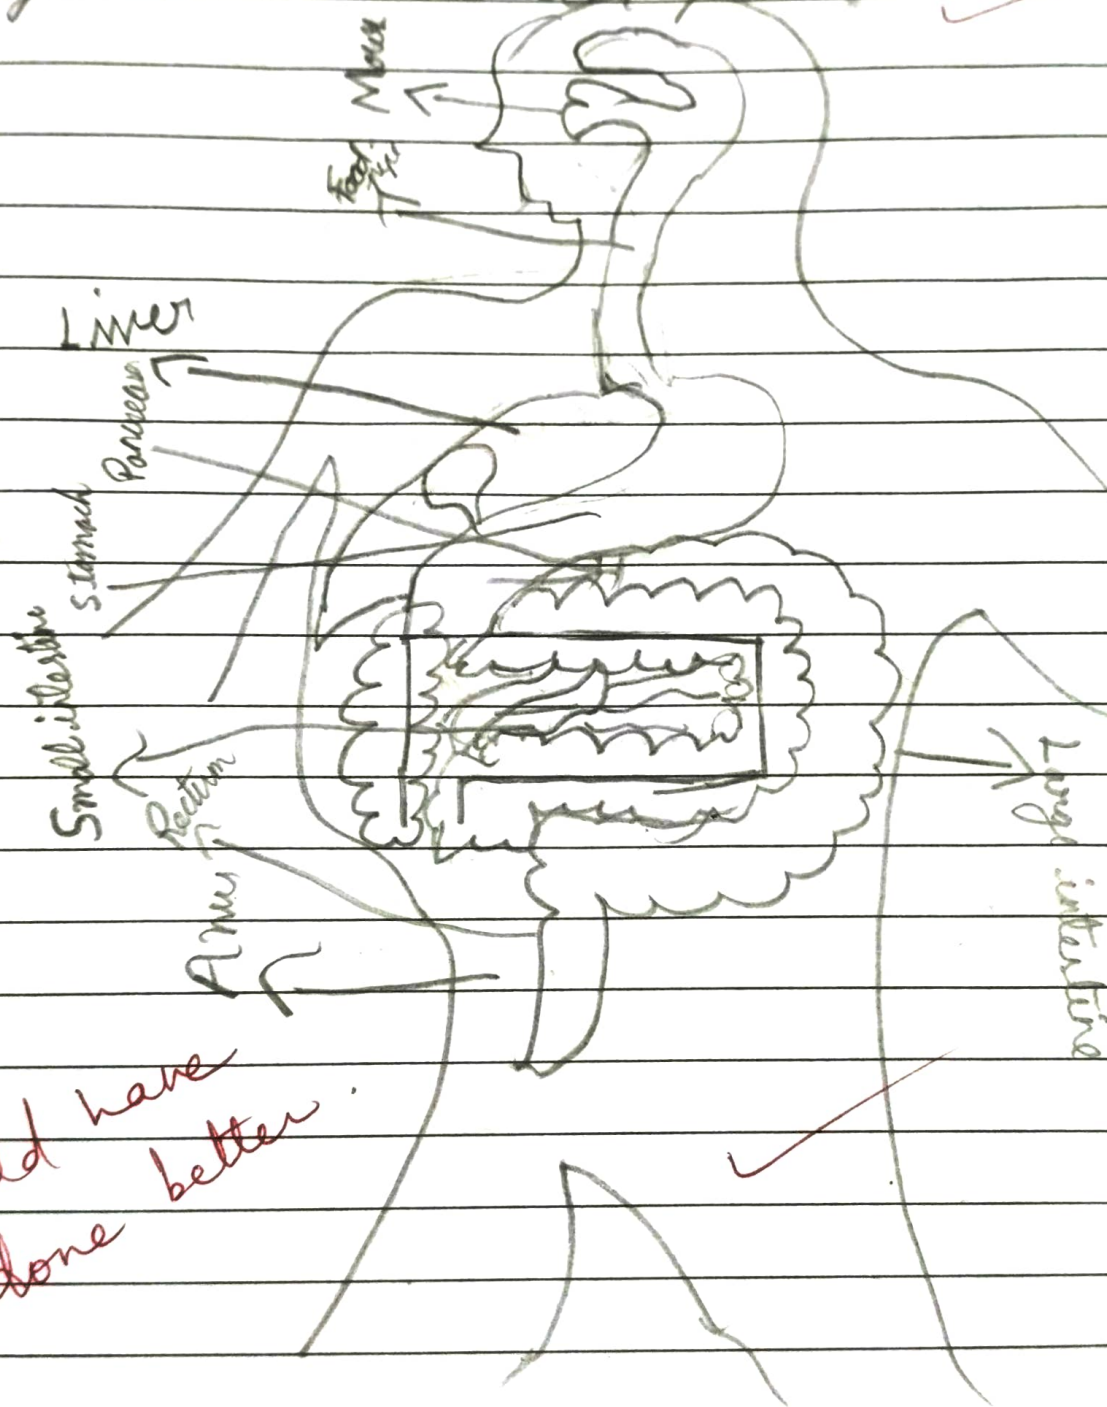

Ans Slow movement gives enough time for digestive juices to break down food properly. It allows the small intestine to absorb all the nutrients.

5 Draw a neat system and

could have
done better.

6 What are germs?

Ans Harmful micro organisms that can enter body and make us sick are known as germs.

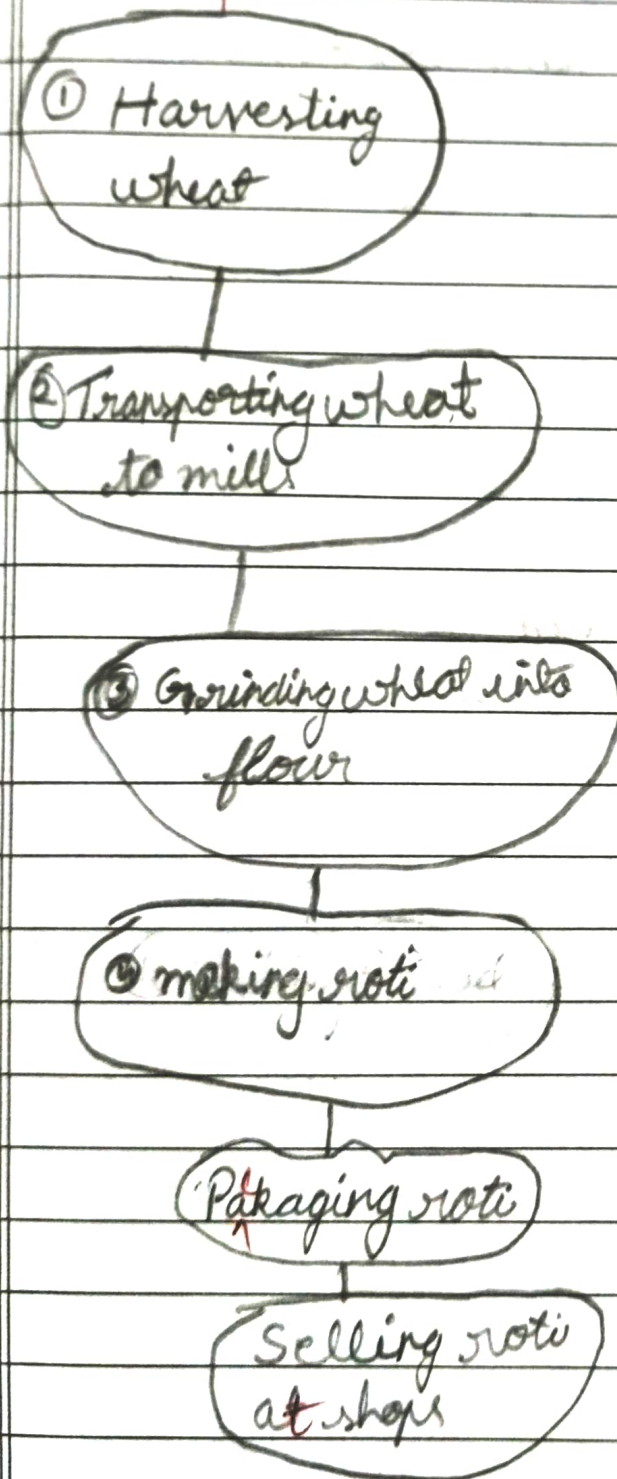

7 What is done in the process of Pasteurisation to preserve milk?

Ans In the process of Pasteurisation milk is heated and then packed in airtight containers.

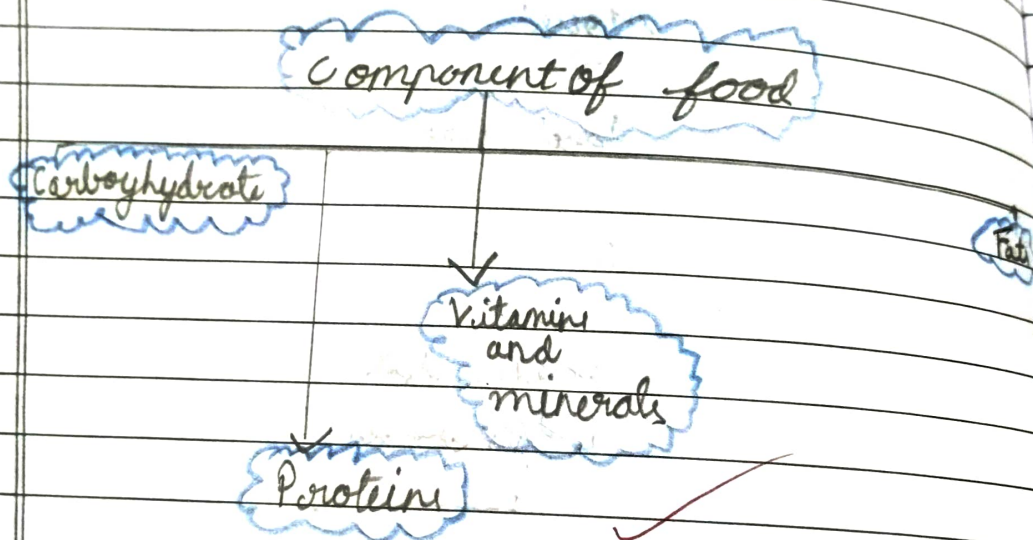

Q Why does the food spoil more easily when kept outside in a warm and humid area?

Ans Germs grow fast in warm and humid places. When food is kept outside in such places, these germs quickly grow on the food and spoil it.

Design a flow chart showing how wheat travels from farm to your plate as roti ✓
