

Matter and its Three States

Solids

- ★ Solid is a hard object
it has mass
it can not flow.

Liquid can flow
it has definite volume
it

Q

A cook wants sugar to ~~dis~~solve in cold tea. Should they stir or leave it still? Which method is better?

Ans

If sugar has to ~~dis~~solve quickly we should stir the cup of tea if we don't stir the liquid immediately surrounding a sugar crystal ~~become~~ saturated.

1 Define :

- 1 Matter - Anything that has mass and occupies space.
- 2 Volume - The space occupied by an object.
- 3 Mass - The total amount of Matter contained in an object.
- 4 Solute - A substance dissolves in another substance.
- 5 Solvent - A liquid substance in which a substance dissolves in it.

Answer the following :

- 1 Rohan left a glass of cold water on the table and later saw droplets outside the glass. What caused this?

Ans Water vapour in the air condenses

Matter - continuation of notes

2. A wooden block placed on a table keeps its ^{shape}, while poured honey spreads slowly and takes the table's shape. Analyze the properties of solids and liquids using this example.

Ans	Solids	Liquids
*	Definite shape	* No definite shape
*	Definite volume	* Definite volume
*	Definite mass	* Definite mass
*	Do not flow	* can flow

3. ~~Explain -~~

3 Explain interchangeability of water.

Ans Interchangeability of water means the change in the state of water from liquid to solid or liquid to gas or vice-versa. Water changes from liquid state to solid state as ice when cooled and it can change from liquid state to gaseous state as water vapour when heated. Similarly, ice when heated melts into water vapour can change to water on cooling.

4 Explain how a solute and a solvent combine to form a solution when mixed.

Ans When the solute and solvent are mixed together and stirred, the solute spreads even in the solvent and a solution is formed.

Q

Give reasons

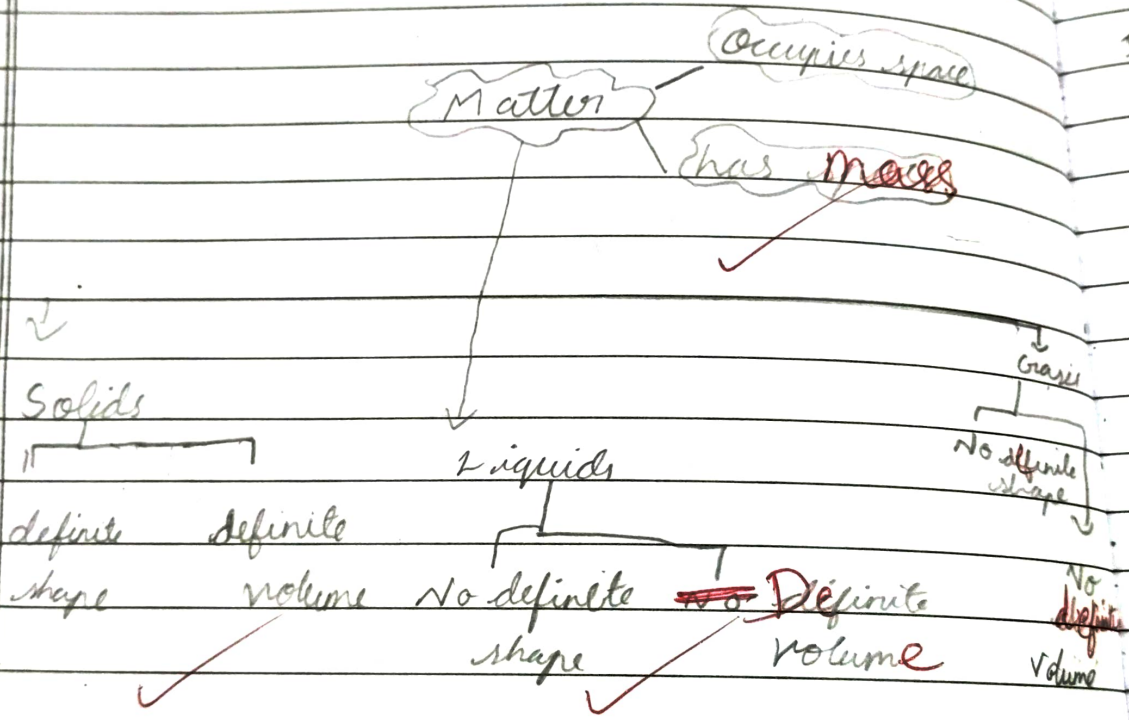

1 When we light an incense stick the smoke spreads everywhere in the room.

A This is because smoke is gaseous state of matter and it tends to occupy all the space available to it.

2 Air is invisible yet it is called matter.

Ans Air is called matter because it has mass and occupies space. Even though air is invisible, we can prove its existence through experiments. For example, an inflated balloon is heavier than a deflated one, showing air has mass. Also when we push an empty glass into the water, it does not fill it because air is already taking up the space inside.
